

## Testing Results for *Borrelia burgdorferi* (Lyme Disease Agent) From Western Black-Legged Ticks (*Ixodes pacificus*)

### Lyme disease

Lyme borreliosis describes human infection with a tick-borne bacteria called *Borrelia burgdorferi*. The tick that transmits this bacteria to humans in California is the western black-legged tick (*Ixodes pacificus*). An informational brochure on Lyme disease in California is available at the California Department of Health Services (DHS) web site: <http://www.dhs.ca.gov/ps/dcdc/pdf/disbindex.htm>.

### Tick-testing results

The Vector-Borne Disease Section (VBDS) collects data on *Ixodes pacificus* ticks tested for *Borrelia burgdorferi* infection throughout the state. In addition to surveillance conducted by VBDS, numerous local agencies forward results to VBDS (see "Contributing Agencies" below). *Borrelia burgdorferi* surveillance in ticks serves to increase public awareness of Lyme disease throughout California.

### Explanation of tests used to detect evidence of *B. burgdorferi* infection in ticks

*Borrelia burgdorferi* bacteria are detected in ticks through tests performed on the content of the tick's digestive tract ("gut") or by testing the entire tick. Different laboratories performed different tests to determine tick infection with *Borrelia burgdorferi*. Each test type described below has different abilities to detect the *Borrelia burgdorferi* bacteria. Also, some laboratories prefer to group several ticks together in "pools" (usually 2 to 10 ticks per pool) to perform one test on several ticks at once. Because of differences in laboratory techniques and procedures, results should be compared only between the same tests and laboratories.

Culture: *Borrelia burgdorferi* bacteria can be grown from infected tick gut in special liquid. This test may miss some ticks infected with *Borrelia burgdorferi*. It is sometimes difficult to grow these bacteria if small numbers of *Borrelia* or large numbers of other bacteria are present.

DFA = Direct Fluorescent Antibody: *Borrelia* bacteria are detected in tick gut by putting on special proteins that will attach to the *Borrelia* bacteria. If *Borrelia* organisms are present, they will glow when viewed under a specially equipped microscope. A positive result means that *Borrelia* bacteria are present, though not necessarily *Borrelia burgdorferi*.

IFA=Indirect Fluorescent Antibody: The IFA is like the DFA except that a sequence of two special proteins is used to detect *Borrelia burgdorferi* in the tick gut. If *Borrelia* organisms are present, they will glow when viewed under a specially equipped microscope. Like the DFA, this test can detect other kinds of *Borrelia* bacteria. However, with the IFA, positive results are more likely to be *Borrelia burgdorferi*.

PCR=Polymerase chain reaction: PCR is used to detect DNA of *Borrelia burgdorferi*, usually from the whole tick. This method can detect either *Borrelia burgdorferi* only or many different kinds of *Borrelia*, depending on how the laboratory runs the test. Very small numbers of *Borrelia* organisms can be detected. However, sometimes ticks that do not have any *Borrelia* can be "positive".

### **How to use this web posting**

A map below shows *Ixodes pacificus* presence and *B. burgdorferi* infection in ticks in California. Detailed data for counties with a dashed square in the center (---) can be accessed by clicking on the square. To return to the map, hit the "previous view" button in the navigation tools or scroll to the top of the document. Some counties (Lassen, Colusa, San Francisco, Stanislaus, Merced, Mono, Kings, Imperial) do not have links because, although ticks have been found in these counties, they have not been tested for *B. burgdorferi*.

### **Abbreviations used in the data for most counties**

County information provided includes:

LOCATION	DATE	SPECIME	RESULT	#POOLED	#POOLS	#POS	TEST	LABORATORY
<u>Location</u>								
<u>Date</u>								
<u>Specime</u>								
<u>Result</u>								
<u>#Pooled</u>								
<u>#Pools</u>								
<u>#Pos</u>								
<u>Test</u>								
<u>Laboratory</u>								

Location = site in the county where the tick was found  
Date = date the tick was collected  
Specime = specimen. This refers to the stage or sex of the tick. Adult, nymph, and larva ticks are tested. For some adult ticks, female or male is noted.  
Result = the result of the test (positive or negative)  
#Pooled = Total number of ticks tested.  
#Pools = Number of pools into which the total number of ticks were divided for testing  
#Pos = The number of positive pools  
Test = The type of test performed  
Laboratory = The laboratory that performed the test

## **Contributing Agencies**

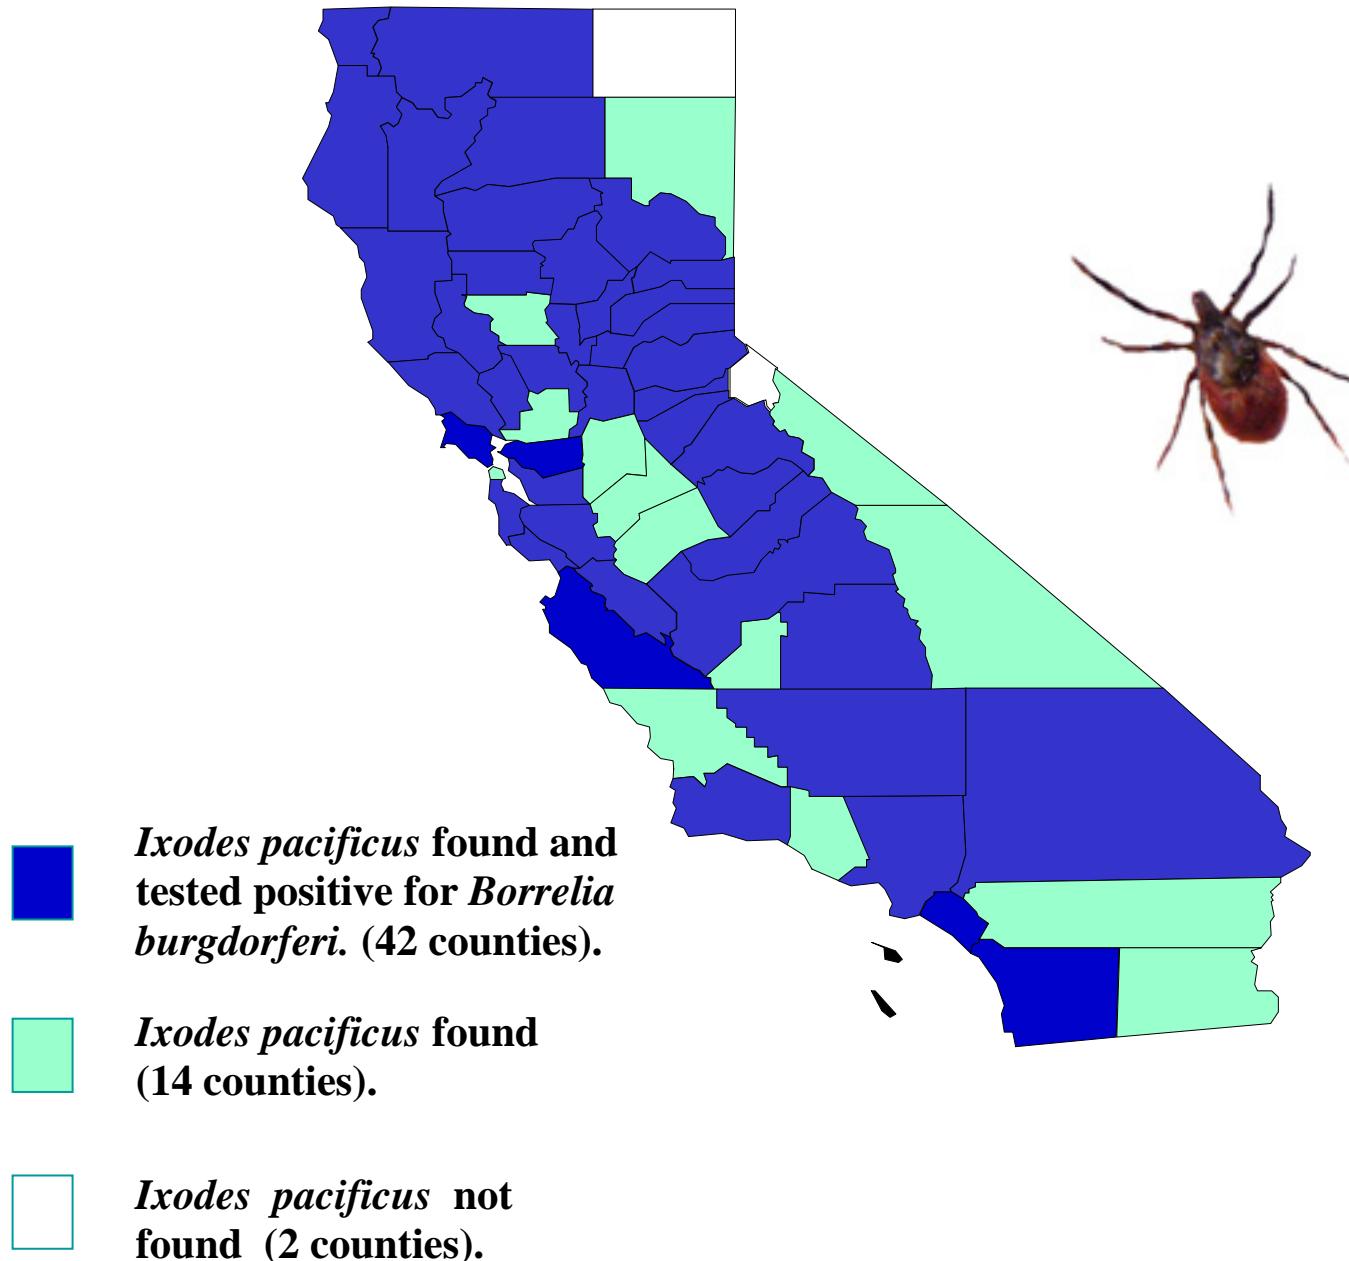

In addition to VBDS, agencies that have contributed to this database include:

- Alameda County Vector Control and Surveillance Division
- Butte County Mosquito and Vector Control District
- City of Moorpark Vector Control
- Contra Costa County Mosquito and Vector Control District
- Inyo County Environmental Health
- Los Angeles County Department of Health Services
- Los Angeles County West Vector Control District
- Marin/Sonoma Mosquito and Vector Control District
- Microbial Disease Laboratory Branch, California Department of Health Services
- Orange County Vector Control District
- Placer County Public Health Laboratory
- Rocky Mountain Laboratories, National Institutes of Health
- San Bernardino County Environmental Health Department
- San Diego County Environmental Health Department
- San Luis Obispo County Health Department
- San Mateo County Mosquito Abatement District
- Santa Barbara County Health Department
- Santa Barbara Coastal Vector Control District
- Santa Cruz County Environmental Health Department
- Sonoma County Public Health Laboratory
- University of California, Berkeley
- United States Army Center for Health Promotion & Preventive Medicine-West
- Viral and Rickettsial Disease Laboratory, California Department of Health Services
- Washoe County Environmental Health Department, Nevada

**For the tick map and data, click here or scroll to the next page.**

## The western black-legged tick (*Ixodes pacificus*) in California

**The western black-legged tick (*Ixodes pacificus*) has been found in 56 of 58 counties to date. The map generalizes available data, and patterns vary within counties.**
